CURING & SEALING CONCRETE

THE CURING AND SEALING PERFORMANCE YOU DEMAND. THE ENVIRONMENTAL RESPONSIBILITY YOU EXPECT.

Euclid Chemical offers a full range of curing and sealing products that meet the toughest environmental and performance standards in the marketplace today. All of your concrete and masonry curing, sealing, and protection challenges can be met with Euclid Chemical's:

- Low VOC products both solvent based and water based that comply with clean air regulations in the U.S. and Canada
- Products that can contribute toward the LEED certification of a project
- Sealers that are uniquely formulated for enhancing and protecting decorative concrete
- Products guaranteed not to yellow in sunlight
- USDA approved products
- Penetrating sealers that protect concrete from the damaging effects of water and salt
- Liquid densifiers for dustproofing, sealing, and strengthening concrete surfaces

We encourage you to contact us with your questions and concerns.

THE IMPORTANCE OF CURING AND SEALING CONCRETE

Curing is the action taken to maintain moisture and temperature conditions in a freshly placed concrete mixture to allow cement hydration to occur so that the potential properties of the concrete may develop. When concrete is not properly cured, its strength, durability, appearance, and resistance to freeze-thaw damage will suffer.

There are three general methods for curing new concrete. The first method is called water curing and involves keeping a continuous flow, ponding, or fog of water on the concrete surface for at least seven days. Often, this is not practical for concrete work as it makes it difficult to impossible for other trades to continue work on the project while the curing is taking place. The second method is the placement of moisture-retaining coverings such as plastic sheeting, wet burlap, or curing blankets over the freshly finished concrete surface. These coverings can be challenging to work and walk on, and can leave stains or marks on the concrete surface if placed improperly. The third method of curing is the application of liquid membrane-forming curing compounds or curing and sealing compounds. Curing and sealing compounds, besides retaining moisture in fresh concrete, have the added benefit of providing a longer-lasting protective and decorative seal on the surface.

By their nature, curing compounds and cure and seals leave a film on the concrete surface that can interfere with the adhesion of other materials such as resilient floor coverings, protective coatings, sealers, or liquid densifying treatments. Because of this, it is tempting to use a silicate solution as the curing compound on new concrete, as silicates do not form a film that can interfere with adhesion. However, silicates do not retain moisture in new concrete, so they do not provide for appropriate curing. The use of a dissipating or removable curing compound is a much more appropriate option to cure new concrete that will later be coated or receive carpet or tile.

BENEFITS OF KEEPING CONCRETE SEALED

Keeping concrete sealed will help prevent water from soaking into the concrete, where it can do damage either by freezing or by corroding the reinforcing steel in the slab. Concrete sealers can also help prevent staining (if spills are cleaned up promptly), and they can act as a sacrificial layer to reduce abrasion and wear from traffic. Finally, some concrete sealers can enhance the color and impart an attractive shine to concrete, which is especially beneficial on stamped, integrally colored, and stained or dyed surfaces.

Penetrating sealers, based on silane or siloxane technology, are especially useful on concrete subjected to water and salt exposure and freeze-thaw cycling. They have a unique ability to prevent water and salt from soaking into concrete and corroding reinforcing steel. Liquid densifiers are most often used indoors to dustproof concrete floors, make the surface denser, and reduce dusting. Both penetrating sealers and densifiers typically do not change the appearance of treated concrete.

CURING & SEALING CONCRETE

PRODUCT ADVANTAGES

CURING COMPOUNDS	ADVANTAGES
KUREZ DR VOX Dissipating curing compound	 Dissipates over time with exposure to UV light and traffic
KUREZ RC Removable curing compound	 Removable curing compound No dissipation time necessary
KUREZ W VOX General purpose, zero VOC	 Low odor Economical curing option for concrete pavement
KUREZ VOX WHITE PIGMENTED Light reflective curing compound	 Efficient curing Keeps concrete cool
KUREZ DR-100 Low VOC dissipating curing compound	• Less than 100 g/L VOC content

SOLVENT BASED CURING AND SEALING COMPOUNDS	ADVANTAGES
REZ-SEAL Acrylic co-polymer, low viscosity	 Good initial cure Seals surface to dustproof and protect
SUPER REZ-SEAL	 High viscosity formulation
High solids acrylic polymer blend	provides greater coverage Excellent curing, durable seal
DIAMOND CLEAR Non-yellowing acrylic blend, low viscosity	 Non-yellowing Excellent for initial curing and sealing of concrete
SUPER DIAMOND CLEAR	Highest performance non-
High solids, non-yellowing	yellowing cure and seal Excellent for architectural
acrylic blend	concrete Good for re-sealing
EVERCLEAR	Excellent sealer for decorative
Breathable, 100% acrylic	concrete Non-yellowing Enhances color and texture
BROWNTONE CS	 Highlights tone of exposed
Pigmented cure & seal for exposed	aggregate concrete surfaces Excellent seal for exposed
aggregate concrete	aggregate precast panels
LUSTERSEAL 300 Pure acrylic sealer	• Non-yellowing

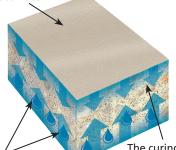

LOW VOC, EXEMPT SOLVENT BASED CURING AND SEALING COMPOUNDS	ADVANTAGES
EVERCLEAR 350 Exempt solvent, pure acrylic cure & seal	 Low VOC Enhances decorative concrete Non-yellowing, breathable formula
LUSTERSEAL 350 Exempt solvent, pure acrylic cure & seal	 Low VOC Non-yellowing Quick dry time is helpful in cool weather
SUPER DIAMOND CLEAR 350 Exempt solvent, cure & seal	• Low VOC • Non-yellowing
DIAMOND CLEAR 350 Low solids, non-yellowing	Cures new concreteEasy to apply
BROWNTONE CS 350 Pigmented cure & seal for exposed aggregate concrete	 Enhances color Provides a glossy appearance

WATER BASED CURING AND SEALING COMPOUNDS	ADVANTAGES
EVERCLEAR VOX Pure acrylic, low VOC cure & seal	 VOC compliant nationwide Blush resistant
DIAMOND CLEAR VOX Non-yellowing acrylic polymer blend	Non-yellowing
SUPER DIAMOND CLEAR VOX Non-yellowing, high solids	 High solids, best curing and gloss Non-yellowing
AQUA-CURE VOX Low odor cure & seal	• Good for interior use
SUPER AQUA-CURE VOX High solids, low odor	• High solids formula
EUCOCURE VOX Acrylic co-polymer cure & seal	Economical Good initial cure & protection
BROWNTONE VOX Brown pigmented cure & seal	• Low VOC • Highlights color

PENETRATING SEALERS	ADVANTAGES
EUCO DIAMOND HARD Silicate/siliconate densifier & sealer	 Improves surface durability Dustproofs and seals Reduces tire marking
ULTRASIL LI+ Lithium silicate densifier	 Seals and densifies floors Easy to apply
EUCOSIL Sodium silicate densifier	 Densifies and dustproofs Economical
SURFHARD Fluorosilicate remedial dustproofer	 Improves surface durability of dusting floors
EUCO-GUARD 100 Solvent based siloxane	 Water and salt repellent for concrete pavement
BARACADE SILANE 40 Solvent based silane	 Deep penetrating formulation Excellent water and chloride barrier Available in an IPA formulation
BARACADE SILANE 100 100% silane	 Highest performance Prevents damage from water and chloride Low VOC formulation
WEATHER-GUARD Economical solvent based siloxane	 Water repellent especially suited for vertical concrete and masonry
BARACADE WB 244 High performance water based silane/ siloxane blend	 Water and salt repellent for concrete pavement and floors Low VOC, low odor Meets NCHRP 244 standards
CHEMSTOP WB REGULAR, HEAVY DUTY Water based silane/siloxane	 Low VOC water and salt repellents Two formulations for customized performance
EUCO-GUARD 350 Low-VOC solvent based siloxane	 Water and salt repellent for concrete and masonry
BARACADE M.E. Concentrated siloxane water repellent	 Dilute with water on the jobsite Customizable for specific applications

FILM-FORMING SEALERS	ADVANTAGES
EUCO #512 VOX EPOXY SEALER	• Low VOC, low odor
Water based epoxy sealer	• Provides chemical resistance
DURAL 50 LM	 Heals hairline cracks; seals
Low viscosity epoxy sealer	surfaces 100% solids formula

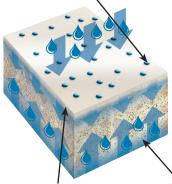

Curing compounds form a film on the concrete surface

Moisture held within the concrete ensures proper hydration of the cement

The curing film reduces evaporation and increases humidity within the concrete

Products that cure and seal offer better protection and repellency at the concrete surface

High solids curing & sealing compounds can offer greater film thickness for added protection Better film integrity means more efficient curing and improved moisture retention

Film-forming sealers offer a thicker and tougher film for superior wear and chemical resistance Sealers are specifically designed to repel liquids. This results in improved chemical and moisture resistance and improves durability of the concrete

Penetrating sealers are breathable and allow moisture in cured concrete to escape. This reduces the risk of rebar corrosion

CURING PRODUCTS

All Euclid Chemical curing compounds meet the requirements of ASTM C 309, are easy to apply, and provide a cost-effective method for initial curing of concrete. A proper cure is vital to full development of concrete's strength and durability. White pigmented curing compounds are available to help reflect sunlight and provide a visual inspection of coverage. Euclid Chemical also provides dissipating and removable curing compounds that are excellent choices for curing when a sealer, coating, or covering will be applied to the concrete at a later date.

CURING AND SEALING PRODUCTS

Concrete curing and sealing compounds have the added benefits of protecting the surface after the curing process is complete, and enhancing the surface appearance with a glossy shine. All Euclid Chemical products designed for curing and sealing meet the requirements of both ASTM C 309 and ASTM C 1315. Euclid Chemical's curing and sealing line includes traditional solvent based products, exempt solvent based products for highly VOC-regulated areas, as well as water based, low odor products for all application environments.

SEALING PRODUCTS

There are two general types of concrete and masonry sealers: filmforming and penetrating. Film-forming sealers reduce penetration of water and contaminants by forming a barrier on the concrete surface; they also darken the concrete and provide varying levels of gloss, giving the substrate a "wet look".

Penetrating sealers and densifiers soak into the concrete or masonry surface and chemically react in the pores to produce a water and chloride repellent barrier. Penetrating sealers last longer than film-forming sealers, and provide protection without changing the appearance. Liquid densifiers are a type of penetrating sealer that both seal the concrete surface and increase the surface density and toughness.

Euclid Chemical offers three types of concrete and masonry sealers:

- Penetrating **silane and siloxane** sealers, in water based, solvent based, and 100% active fomulations
- Film-forming epoxy sealers that give an enhanced, glossy appearance and protection against water and some mild chemicals
- Silicate and siliconate based liquid densifiers that penetrate and chemically react with the concrete to dustproof and improve the durability of the surface

The Euclid Chemical Company serves the global building market as an ISO 9001:2000 supplier of specialty products and support services the for the concrete and masonry construction industry. Marketed under the Baracade, Dural, Euco, Eucon, Speed Crete and Tamms brands, we offer a full line of admixtures, repair and maintenance products based on the latest technologies. We provide complete assistance and laboratory support as well as on-site service for guidance on proper product usage. EUCO materials are warehoused in over 200 locations in the USA and are available worldwide through international affiliates.

CURING & SEALING CONCRETE

TROUBLESHOOTING GUIDE

When a film-forming concrete sealer does not perform properly, or the appearance is not what was expected, the cause can usually be traced back to improper product selection or application. Most problems can be avoided by carefully reading the product's technical data sheet before use. For step-by-step application instructions, watch Euclid Chemical's solvent based sealer application video on YouTube or at euclidchemical.com.

NOTE: This information is supplied as a general guide to troubleshooting concrete sealer issues. Each situation is different, and results may vary. Whatever remediation method is chosen should be performed on a small test section before addressing the entire area to determine if the results are acceptable.

Why did the sealer bubble?

Cause: Product was applied too heavily, or in hot weather/direct sun.

Prevention: Carefully follow manufacturer's recommended coverage rate and apply during the coolest part of the day when concrete is not in direct sun. Two thin coats should be applied rather than one heavy coat.

Why did the sealer turn white?

Cause: Product was applied too heavily or there are too many coats of sealer on the concrete, and moisture trapped underneath the sealer has caused it to lose adhesion from the concrete.

Prevention: Follow manufacturer's recommended coverage rate; do not re-seal concrete until previous coat(s) have worn away or have been stripped off.

Why is the sealer peeling or flaking off?

Cause: Product was applied too heavily or there are too many coats of sealer on the concrete OR concrete was not prepared properly before application. Since concrete cure and seal products last 1 to 3 years, some peeling and flaking should be expected as the product wears away, especially in areas of high traffic or direct sunlight.

Prevention: Follow manufacturer's recommended coverage rate and preparation methods; do not re-seal concrete until previous coat(s) have worn away.

Why did a water-based sealer turn milky-white or powdery?

Cause: Product was applied in low temperature or high humidity conditions or where air flow is low (basement, closed garage, etc.) OR product was applied too heavily.

Prevention: Follow manufacturer's recommended coverage rate and application conditions.

Why are oil, leaves, tires, fertilizer, etc. staining the sealer?

Cause: Most concrete sealers will not prevent stains.

Prevention: Prevent oil and other chemical drips from cars and equipment. Sweep tree debris and fertilizer granules from concrete as often as possible.

Why is the concrete dark and blotchy after the sealer was applied?

Cause: Uneven application or wrong product choice.

Prevention: Follow the application methods on the product's technical data sheet.
